Overview

The Optimus Red sound level meter is for measuring sound levels in factories and other work environments in line with the occupational noise regulations.

Octave Band Filters

This version of the Optimus is fitted with real-time octave band filters. The nature of "real-time" filters is that the meter measures in all bands at the same time - parallel filters.

Octave bands gives a description of the frequency content of the noise measured. The most common use is for selecting the correct hearing protectors, ensuring that they attenuate the sound levels at the frequencies of interest.

The NoiseTools software, which is included with this meter, has a calculator that takes the octave band measurement and calculates the assumed level at the ear when using different hearing protectors.

Buying the Right Meter

Most occupational noise regulations state that you should use at least a Class 2 Integrating Sound Level Meter that provides you with measurements of LAeq and LPeak. The meter should be verified by a suitably equipped laboratory when new and every year or two years. You also need a Calibrator to check the meter's function before making measurements.

Our Recommendation

For a full occupational noise assessment with detailed hearing protector selection, especially for areas with very high noise levels, we recommend the **CK162C** Octave Band Measurement Kit. This includes a suitable calibrator, carrying case and software.

If you only need to carry out a basic occupational noise survey, still in line with the regulations, then see the standard Optimus Red sound level meter.
